MEASUREMENT COMMITTEE

MGT & LARGE HEADBOARD

PROPOSAL

Review the way MGT is measured for mainsails fitted with large headboards. If $HB > 0.1 \cdot E$, MGT shall to be taken half way along the **Leech** between the $\frac{3}{4}$ point and the **Aft Head Point** (not the **Head Point**).

RATIONALE

On sails fitted with large headboards, the physical position of MGT is at present always taken far too high. MGT is smaller than its true geometrical representation resulting in a smaller calculated Mainsail Area and a distorted leech curve on the drawing displayed on the certificate.
